Example of a 13 6 Challenge Problem

To illustrate the application of the above techniques, consider a hypothetical 13 6 challenge problem based on a manufacturing company, XYZ Corp.

Scenario: XYZ Corp. manufactures and sells widgets. The company provided the following financial data for the year:

- Sales Revenue: \$500,000
- Cost of Goods Sold (COGS): \$300,000
- Operating Expenses: \$150,000
- Interest Expense: \$20,000
- Tax Rate: 30%

Questions:

1. Calculate the Gross Profit.
2. Determine the Net Income.
3. Calculate the Operating Margin.
4. What is the Break-even Point in sales dollars?

Solution Steps

1. Calculate Gross Profit:

- Formula: $\text{Gross Profit} = \text{Sales Revenue} - \text{COGS}$
- Calculation: $\$500,000 - \$300,000 = \$200,000$

2. Determine Net Income:

- Formula: $\text{Net Income} = (\text{Sales Revenue} - \text{COGS} - \text{Operating Expenses} - \text{Interest Expense}) (1 - \text{Tax Rate})$
- Calculation:
- Earnings Before Tax = $\$500,000 - \$300,000 - \$150,000 - \$20,000 = \$30,000$
- Net Income = $\$30,000 (1 - 0.30) = \$30,000 \cdot 0.70 = \$21,000$

3. Calculate Operating Margin:

- Formula: $\text{Operating Margin} = \text{Operating Income} / \text{Sales Revenue}$
- Calculation:
- Operating Income = $\text{Sales Revenue} - \text{COGS} - \text{Operating Expenses} = \$500,000 - \$300,000 - \$150,000 = \$50,000$
- Operating Margin = $\$50,000 / \$500,000 = 0.10$ or 10%

4. Break-even Point in Sales Dollars:

- Formula: $\text{Break-even Point} = \text{Fixed Costs} / (\text{Sales Price per Unit} - \text{Variable Cost per Unit})$
- Assume Selling Price per Unit = \$50, and COGS (Variable Cost) per Unit = \$30.
- Fixed Costs = $\text{Operating Expenses} + \text{Interest Expense} = \$150,000 + \$20,000 = \$170,000$.
- Break-even Point = $\$170,000 / (\$50 - \$30) = \$170,000 / \$20 = 8,500$ units.
- Break-even Sales Dollars = $8,500 \text{ units} \cdot \$50 = \$425,000$.
