CPU (Central Processing Unit)

The CPU is the brain of the PLC system, executing control instructions and managing communication between modules. Allen Bradley offers different CPU models with varying processing speeds and memory capacities tailored to application needs.

Power Supply

The power supply module provides necessary electrical power to the PLC and its connected modules. Ensuring proper power specifications is essential for stable and reliable operation.

Input/Output Modules

Input modules receive signals from external devices such as sensors and switches, while output modules send control signals to actuators like motors and solenoids. Allen Bradley offers digital and analog I/O modules to accommodate various signal types.

Communication Modules

Communication modules facilitate data exchange between the PLC and other devices or networks, enabling integration into larger control systems or remote monitoring setups.

Introduction to PLC Programming

Programming is the core skill in Allen Bradley PLC training for beginners, allowing users to define how the PLC responds to inputs and controls outputs. Understanding programming fundamentals prepares learners to develop functional and efficient control logic.

Programming Languages

Allen Bradley PLCs support multiple programming languages standardized by IEC 61131-3, including Ladder Logic, Function Block Diagram (FBD), Structured Text (ST), and Sequential Function Chart (SFC). Ladder Logic is the most common and beginner-friendly language used in Allen Bradley systems.

Programming Concepts

Key programming concepts include scanning cycles, timers, counters, and data manipulation. Understanding how the PLC scans and executes the program is vital for creating responsive and reliable control systems.

Software Tools for Allen Bradley PLCs
