- Project Browser: This panel displays your models, experiments, and other project components.
- Palette: A collection of modeling elements that you can drag and drop into your model.
- Properties Panel: This panel allows you to customize the properties of selected elements.
- Simulation Controls: Start, stop, and manage your simulations easily.

1.3 Understanding Modeling Concepts

Before you start building models, it's crucial to understand some fundamental concepts:

- Agents: The building blocks of AnyLogic models, representing entities that interact within the simulation.
- Processes: Sequences of events or actions that agents undergo.
- Parameters: Variables that define specific characteristics of agents and processes.

1.4 Creating Your First Model

Now that you have familiarized yourself with the interface and basic concepts, it's time to create your first model:

1. Open a new project in AnyLogic.
2. Drag and drop a few agents from the palette into the workspace.
3. Use the properties panel to customize the agents' parameters.
4. Create simple processes to illustrate interactions between agents.

Day 2: Advanced Modeling Techniques

On the second day, you will delve deeper into advanced modeling techniques, focusing on discrete-event simulation and system dynamics.

2.1 Discrete-Event Simulation (DES)

Discrete-event simulation is a vital aspect of AnyLogic that allows you to model systems where changes occur at distinct points in time. To master DES:

- Understanding Events: Learn how to create and manage events within your model.
- Using the Event Block: This block can be used to schedule events and define their actions.
- Implementing Queues: Queues are essential for modeling processes that require waiting (e.g., server queues).

2.2 System Dynamics (SD)

System dynamics focuses on the relationships between different components of a system over time. To understand SD in AnyLogic:

- Stock and Flow Diagrams: Learn how to use these diagrams to model accumulations and movements within systems.
- Feedback Loops: Understand how to create and manage positive and negative feedback loops within your models.

2.3 Learning through Examples

To reinforce your learning, examine existing models provided within AnyLogic:

1. Open the AnyLogic model library.
2. Browse various models related to your area of interest (e.g., supply chain, healthcare, traffic).
3. Analyze the structure and logic of these models to understand how advanced techniques are

implemented.

Day 3: Practical Applications and Model Validation

On the final day, you will focus on applying your knowledge to real-world scenarios and validating your models.

3.1 Applying AnyLogic to Real-World Problems

Understanding how to apply your modeling skills to practical situations is crucial. Consider the following steps:

- Identify a Problem: Choose a real-world problem or scenario that interests you.
- Model the Problem: Use the techniques you learned on Day 2 to create a model addressing this problem.
- Run Simulations: Perform simulations to explore different outcomes and solutions.

3.2 Model Validation Techniques

Validating your model is essential to ensure it accurately represents the real-world scenario you are simulating. Focus on these validation techniques:

- Comparison with Historical Data: Compare your model's output with historical data to assess accuracy.
- Sensitivity Analysis: Test how changes in parameters affect model outcomes to identify critical factors.
- Peer Review: Share your model with peers or mentors for feedback and suggestions for improvement.

3.3 Creating Documentation and Presenting Your Model

Once your model is validated, it's time to document and present your work:

- Documentation: Create detailed documentation outlining the purpose, methodology, and findings of your model.
- Presentation Skills: Prepare a presentation to showcase your model to stakeholders or an audience. Highlight key findings and insights derived from your simulation.
