Key Topics and Practice Problems

To further enhance understanding, here are some key topics from Chapter 6 along with example problems:

1. Calculating the Area of Polygons

- Example Problem: Find the area of a triangle with a base of 10 units and a height of 5 units.
- Solution: $\text{Area} = (\text{base} \times \text{height}) / 2 = (10 \times 5) / 2 = 25$ square units.
- Example Problem: Determine the area of a rectangle with a length of 8 units and a width of 4 units.
- Solution: $\text{Area} = \text{length} \times \text{width} = 8 \times 4 = 32$ square units.

2. Working with Circles

- Example Problem: Calculate the circumference of a circle with a radius of 7 units.
- Solution: $\text{Circumference} = 2\pi r = 2 \times \pi \times 7 \approx 43.98$ units.
- Example Problem: Find the area of a circle with a diameter of 10 units.
- Solution: First, find the radius ($r = \text{diameter} / 2 = 10 / 2 = 5$). $\text{Area} = \pi r^2 = \pi \times (5)^2 \approx 78.54$ square units.

Conclusion
