Genetics and Genomic Terms

Genetics and genomics are core fields within biology that study genes, heredity, and the complete set of DNA in organisms. Numerous important terms starting with "G" relate to these disciplines, providing foundational knowledge about genetic material and its function.

Gene

A gene is a fundamental unit of heredity in living organisms, composed of DNA sequences that encode functional products, typically proteins. Genes determine specific traits by directing the synthesis of proteins through transcription and translation processes. They are located on chromosomes within the cell nucleus.

Genotype

The genotype refers to the genetic makeup of an organism, encompassing all the alleles inherited from its parents. Unlike phenotype, which represents observable traits, genotype includes the specific set of genes that may influence those traits. Genotype plays a crucial

role in heredity, evolution, and genetic variation.

Genome

The genome is the complete set of genetic material present in an organism or a cell. It includes all genes as well as noncoding sequences of DNA. Genomic studies involve sequencing and analyzing genomes to understand organismal complexity, genetic diseases, and evolutionary relationships.

Genetic Drift

Genetic drift is a mechanism of evolution involving random fluctuations in allele frequencies within a population. Unlike natural selection, genetic drift is stochastic and can lead to the loss or fixation of alleles, especially in small populations. It contributes to genetic diversity and population differentiation.

Glycolysis

Glycolysis is a metabolic pathway that breaks down glucose into pyruvate, generating energy in the form of ATP and NADH. This anaerobic process takes place in the cytoplasm and is the first step in cellular respiration, essential for energy production in most organisms.

Glycogen

Glycogen is a polysaccharide that serves as a primary storage form of glucose in animals and fungi. It is predominantly stored in the liver and muscle cells and can be rapidly mobilized to meet energy demands.

Glycoprotein

Glycoproteins are proteins covalently bonded to carbohydrate groups, playing key roles in cell-cell recognition, signaling, and immune responses. They are commonly found on cell surfaces and within extracellular matrices.

Guild

A guild in ecology refers to a group of species that exploit the same class of environmental resources in a similar way. Members of a guild may not be closely related taxonomically but share ecological roles, such as a guild of nectar-feeding birds.

Greenhouse Effect

The greenhouse effect is a natural process where certain gases in the Earth's atmosphere trap heat, maintaining temperatures conducive to life. However, anthropogenic activities have intensified this effect, contributing to global warming and climate change.

Gross Primary Productivity (GPP)

Gross primary productivity is the total amount of energy captured by photosynthetic organisms in an ecosystem. It represents the total carbon fixed before accounting for energy used in respiration, serving as a key metric in ecosystem energy flow.

Grassland

Grasslands are ecosystems dominated by grasses and herbaceous plants, supporting diverse animal species and playing a significant role in carbon sequestration and soil conservation. They are found in regions with moderate rainfall and varying climates.

The glomerulus is a network of capillaries located in the nephron of the kidney, responsible for filtering blood to form urine. It plays a vital role in maintaining homeostasis by regulating waste removal and fluid balance.

Ganglion

A ganglion is a cluster of nerve cell bodies located outside the central nervous system. Ganglia function as relay points, processing and transmitting neuronal signals to and from different body regions.

Gastric Juice

Gastric juice is a digestive fluid secreted by the stomach lining, containing hydrochloric acid and digestive enzymes such as pepsin. It facilitates the breakdown of proteins and protects against pathogens.

Gonad

Gonads are the primary reproductive organs—ovaries in females and testes in males—that produce gametes and secrete sex hormones critical for reproduction and secondary sexual characteristics.
