- **Flow Rate (Q):** The volume of fluid passing through a system per unit time, typically measured in cubic meters per second (m^3/s) or gallons per minute (GPM).
- **Pressure Drop (ΔP):** The difference in pressure between two points in a system, often caused by friction and resistance in valves and fittings.
- **Viscosity (μ):** A measure of a fluid's resistance to flow, which affects the flow rate and pressure drop in hydraulic systems.
- **Reynolds Number (Re):** A dimensionless number that helps predict flow patterns in different fluid flow situations, indicating whether the flow is laminar or turbulent.
- **Specific Gravity (SG):** The ratio of the density of a fluid to the density of water,

influencing the behavior of fluids in hydraulic systems.
