Types of Assessment Questions

The Unit 7 assessment typically includes a variety of question types designed to test students' understanding of the material. Here's a breakdown of the common formats:

Multiple Choice Questions

These questions assess students' knowledge of key concepts and definitions.

Examples include:

- What is the output of a specific function?
- Which algorithm is most efficient for a given problem?

Code Writing Tasks

Students may be asked to write code snippets to solve particular problems. This could involve:

- Creating a function that performs a specific calculation.
- Debugging a piece of code to identify errors and correct them.

Scenario-Based Questions

These questions present a programming scenario and ask students to analyze or solve it. For example:

- Given a function that processes user input, how would you modify it to handle errors?
- Describe how you would use loops to optimize a task that involves repetitive actions.
