The February 3, 2021 Cold Snap

On February 3, 2021, Boston was gripped by an Arctic air mass that swept across the northeastern United States. The city recorded a bone-chilling temperature of -10°F , with wind chills making it feel even colder, at around -30°F in many areas.

The Meteorological Factors

Several meteorological factors contributed to this extreme cold:

1. Polar Vortex: The polar vortex, a large area of low pressure and cold air surrounding the

Earth's poles, dipped southward, bringing frigid temperatures to the northeastern U.S.

2. High Pressure Systems: A high-pressure system settled over the eastern United States, allowing cold air to pool in the region.

3. Snow Cover: With extensive snow cover from previous storms, the ground retained the cold, further chilling the air above it.
